Art Unit: 1625

Continued Prosecution Application

The request filed on 4/25/2003 for a Continued Prosecution Application (CPA) under 37 CFR 1.53(d) based on parent Application No. 09/284,160 is <u>acceptable</u> and a CPA has been established. An action on the CPA follows.

The Status of Claims:

Claims 19-34 are pending.

Claims 19-34 have been rejected.

DETAILED ACTION

1. Claims 19-34 are under consideration in this Office Action.

Priority

2. Acknowledgment is made of applicants' claim for foreign priority under 35 U.S.C. 119 (a)-(d).

Drawings

3. There are no drawings filed on 4/25/2003.

Claim Rejections - 35 USC § 112

Claims 19 and 34 are rejected under 35 U.S.C. 112, first paragraph, because the specification, while being enabling for a basic extractant, such as primary ,secondary and, tertiary amines having at least a total number of 18 carbon atoms, does not

Art Unit: 1625

reasonably provide enablement for all the possible basic extractants known in the art. The specification does not enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to include all the possible basic extractants unrelated to the current invention commensurate in scope with these claims.

Furthermore, the instant specification fails to provide information that would allow the skilled artisan to practice the instant invention without <u>undue experimentation</u>.

Attention is directed to *In re Wands*, 8 USPQ2d 1400 (CAFC 1988) at 1404 where the court set forth the eight factors to consider when assessing if a disclosure would have required undue experimentation, citing *Ex Parte Forman*, 230 USPQ 546 (BdApls 1986) at 547 the court recited eight factors:

- 1) the quantity of experimentation necessary,
- 2) the amount of direction or guidance provided,
- 3) the presence or absence of working examples,
- 4) the nature of the invention,
- 5) the state of the prior art,
- 6) the relative skill of those in the art,
- 7) the predictability of the art, and
- 8) the breath of the claims.

In the instant case, the claim encompasses <u>various</u> basic extractants. However, applicants' specification provide only one exemplified basic extractant (tricaprylyl amine) in all the examples. Furthermore, there is an unpredictable aspect in applying various

Art Unit: 1625

basic extractants to the process of recovering the lactic acid; tricaprylyl amine extractant can not be the representative for all the possible basic extractants because they may behave differently in comparison to the tricaprylyl amine extractant; for example, under certain reaction conditions, at a specific pressure and temperature, one basic extractant has possessed a superior extractive property to another basic extractant depending on the corresponding basic chemical structures. Thus, the specification herein have failed to provide sufficient working examples to support the use of <u>various</u> basic extractants. Therefore, an appropriate correction is required.

The specification, while being enabling for an acid, such as sulfuric acid, does not reasonably provide enablement for all the possible acids known in the art. The specification does not enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to include all the possible acids including, such as , solid aliphatic ring acids, heterocyclic acids, which are not enabled. "Foreman factors" necessarily arise because of <u>unpredictability</u>. In addition, long chain large molecular weight acids behave more differently than those of the claimed invention, which would require more than routine experimentation. See <u>In re</u> Armbruster 185 USPQ 204 (CCPA 1985) and Angstadt et al. , 190 USPQ 152 (CCPA 1990).

Claims 19 and 31 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

In claim 19, the phase "lactic acid in an amount greater than said portion and a lactic-acid-depleted, lactate salt-containing aqueous solution" is stated. This expression is vague as to how much lactic acid is greater in an amount than said portion and a lactic-acid-depleted, lactate salt-containing aqueous solution during the process. An appropriate correction is recommended.

In claim 31, the phase " an acid stronger than lactic acid" is stated. This expression is vague as to how much the acid is stronger than lactic acid during the process. An appropriate correction is recommended.

4. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(f) or (g) prior art under 35 U.S.C. 103(a).

Claim Rejections - 35 USC § 103

- 5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Art Unit: 1625

- 6. The factual inquiries set forth in Graham v. John Deere Co., 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:
 - 1. Determining the scope and contents of the prior art.
 - 2. Ascertaining the differences between the prior art and the claims at issue.
 - 3. Resolving the level of ordinary skill in the pertinent art.
 - 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.
- 7. Claims 19-34 are rejected under 35 U.S.C. 103(a) as being unpatentable over Baniel et al (U.S. 5,510,526).

Baniel et al discloses a process for the recovery of lactic acid, from a lactate solution composed of sodium lactate, calcium lactate or potassium lactate (see col. 11, lines 33-34), from a fermentation broth at a pH in the range of 5.5 to 6.5 (see col. 6, lines 6-7) by using a long-chain trialkyl amine in the presence of carbon dioxide by way of extraction (see col. 3, lines 39-44). For example, an extractant comprising tridodecylamine and butanol is contacted with 30 % by weight aqueous lactic acid to produce 6.9 % by weight lactic acid in the organic phase (see col. 11, Ex. 3).

In the process the organic phase obtained from the primary extraction is further subjected to a separation process such as back extraction, vaporization (see col. 4, lines 60-65) to recover 97 % lactic acid from the original mixture (see col. 11, lines 8-9); the solvent can be used with water for the purpose of diluting viscous trialkyl amines or enhancing the extraction (see col. 4, lines 42-46). In addition, the depleted extractant can be replenished with butanol, and recycled for another extraction (see col. 11, lines 13-14). Also, the reference teaches that it is plausible to recover the lactic acid by acidifying the fermentation broth with sulfuric acid; as a result, a sulfate salt is formed (see col. 1, lines 55-59).

Art Unit: 1625

However, the instant invention differs from Baniel et al in that the ratio between free lactic acid and lactate salt is mentioned; at least 70 % of the free lactic acid is extracted from the aqueous solution.

Metz et al teaches a process of manufacturing compounds more than 3 mole of free lactic acid per mole of calcium lactate by using calcium oxide, calcium hydroxide, and calcium carbonate (see col. 2 ,lines 28-32).

Concerning Baniel et al's failure to mention the ratio between free lactic acid and lactate salt and the extraction of at least 70 % of the free lactic acid from the aqueous solution, Baniel et al is silent about them. However, the fermentation broth may contain some of free lactic acid and lactate salt. With respect to the 70 % of free lactic acid being extracted from the aqueous solution, the limitation of a process with respect to ranges of pH, time, ratio and concentration does not impart patentability to a process when such values are those which would be determined by one of ordinary skill in the art in achieving optimum operation of the process. For examples, ratio and concentration are well understood by those of ordinary skill in the art to be result-effective variables, especially when attempting to control selectivity of a chemical process.

Baniel et al does teach the process for the recovery of lactic acid, from a lactate solution composed of sodium lactate, calcium lactate or potassium lactate from a fermentation broth at a pH in the range of 5.5 to 6.5 by using a long-chain trialkyl amine in the presence of carbon dioxide by way of extraction. Furthermore, the fermentation

Art Unit: 1625

broth may contain some of free lactic acid and lactate salt as raw starting ingredients for the process. Therefore, it would have been obvious to the skilled artisan in the art to have motivated to optimize the ratio between free lactic acid and lactate salt of the fermentation broth in the Baniel et al through routine experimentations in order to maximize the yield of the lactic acid. This is because the skilled artisan in the art would expect the Baniel et al process to increase the production of lactic acid by the manipulation of the ratio between the free lactic acid and lactate salt in the fermentation broth as the starting ingredients.

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Eyal et al (U.S. 5,766,439) discloses a process for producing an organic acid in the following steps: producing an organic acid by fermentation, adding an alkaline earth base to the fermentation, reacting the alkaline earth salt of the organic acid with a source of ammonium ions, reducing the concentrations of divalent cations, and converting the ammonium of the organic acid to free organic acid.

Sterzel et al (U.S. 5,453,365) discloses a preparation of lactates by fermentation of the mixture of sugars, conversion of the lactic acid followed by esterification during the process, in which the lactic acid is neutralized with an alkaline earth metal carbonate, added with ammonia and carbon dioxide, and the purified ammonium lactate solution is esterified with an alcohol.

Urbas (U.S. 4,444,881) discloses a process for the recovery of organic acids from dilute aqueous solutions in the following steps: adding a water-soluble tertiary

Art Unit: 1625

amine carbonate to the calcium salt solution to form the trialkylammonium salt of the acid, and heating the concentrated trialkylammonium salt solution to obtain the acid and the amine.

Cockrem et al (U.S. 5,210,296) discloses a process for producing a high pure lactate ester or lactic acid from a concentrated fermentation broth by acidification in the presence of an alcohol with sequential esterification, distillation of high purity ester.

Walkup et al (U.S. 5,252,473) discloses a process of producing lactic acid and esters of lactic acid in the following reactions. In the first reaction, ammonium lactate produced by a fermentation process of carbohydrate materials can be decomposed into NH₃ and lactic acid; in the second reaction, the lactic acid can be further esterified with methanol to yield methyl lactate. In the esterification of the ammonium lactate to the alkyl lactate, the reaction mixture pressure is from 1 atmosphere to 200 atmospheres and the reaction temperature is from 100° C. To 200° C.; besides, the range for the molar ratio of alcohol to ammonium salt in the reaction mixture is from 1:1 to 10:1. In the process, in order to increase the yield of methyl lactate, NH₃ can be either removed or recycled to produce ammonium lactate.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to T. Victor Oh whose telephone number is (703) 305-0809. The examiner can normally be reached on Monday through Friday from 8:30 to 5:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Alan Rotman, can be reached on (703) 308-4698. The fax phone number for the organization where this application or proceeding is assigned is (703) 308-4556.
